Best Management Practices

MISSOURI DEPARTMENT OF CONSERVATION

Running Buffalo Clover

Trifolium stoloniferum

Common name • Running Buffalo Clover Scientific name • *Trifolium stoloniferum* Federal status • Endangered State status • Endangered

Ecology

Running buffalo clover was historically widespread from Kansas to West Virginia. In Missouri, running buffalo clover has recently been found in three natural sites and has been reintroduced at a number of sites. The plant favors moist, open woodlands and streambanks. It grows in areas that have a pattern of long-term moderate disturbance such as mowing, trampling or grazing.

Reasons for Decline

Running buffalo clover may have depended on bison to maintain its moderately disturbed habitat, as well as to scarify and disperse seeds. As bison were eliminated, so was suitable habitat and a means of seed dispersal. Other historical causes of decline may include habitat destruction, increased competition from exotic plants, and reduced fire frequency resulting in loss of open woodlands. Running buffalo clover is currently threatened by habitat loss, population isolation, competition from non-native plants, and excessive grazing.

Specific Recommendations

Project activity in the vicinity of known running buffalo clover sites should be consistent with the maintenance of open woodland habitat. Moderate disturbances such as prescribed fire and grazing should be allowed to continue in order to maintain suitable habitat.

- → Do not use any herbicides at running buffalo clover sites unless all of the clover plants are located and spot spraying can be conducted without contacting the clover.
- → Selective harvest of timber is acceptable if clover plants are protected from physical destruction and a partial tree canopy is maintained.
- ightarrow Do not mow or otherwise disrupt plants during the period of sexual reproduction (April through August).
